

symPrint Issue 3: Overview

Using the example “Reduced” label on the left, ***symPrint*** Issue 3 shows how Symbol’s Adaptive Printer Driver (APD) removes the need for application programs (either on the Symbol PDT, or on a host server if using Symbol PocketBrowser) to deal with printer-specific command codes. This means that the application can run with virtually any portable label printer without needing any knowledge of that printer’s command language, or of the means of communication between terminal and printer.

symPrint provides a simple step-by step guide showing how working files are generated for three popular types of printer. It also shows how the process can be adapted to other printers.

symPrint is available to licenced users of Symbol’s Adaptive Printer Driver, on request to printers@uk.symbol.com.
